

Longest Substring Without Repeating Characters:-

Code:-

```
class Solution {
    public int lengthOfLongestSubstring(String s) {
        int maxLength = 0;
        int left = 0;
        int[] lastSeen = new int[128];
        for (int i = 0; i < 128; i++) {
            lastSeen[i] = -1;
        }
        for (int right = 0; right < s.length(); right++) {
            char currentChar = s.charAt(right);
            if (lastSeen[currentChar] >= left) {
                left = lastSeen[currentChar] + 1;
            }
            lastSeen[currentChar] = right;
            maxLength = Math.max(maxLength, right - left + 1);
        }
        return maxLength;
    }
}
```

Output:-

Find and Replace Pattern Solution:-

Code:-

```
class Solution {
    public List<String> findAndReplacePattern(String[] words, String pattern) {
        List<String> result = new ArrayList<>();
        for (String word : words) {
            if (matches(word, pattern)) {
                result.add(word);
            }
        }
        return result;
    }
    private boolean matches(String word, String pattern) {
        int[] wordToPattern = new int[256];
        int[] patternToWord = new int[256];
        for (int i = 0; i < word.length(); i++) {
            char w = word.charAt(i);
            char p = pattern.charAt(i);
            if (wordToPattern[w] == 0 && patternToWord[p] == 0) {
                wordToPattern[w] = p;
                patternToWord[p] = w;
            } else if (wordToPattern[w] != p || patternToWord[p] != w) {
                return false;
            }
        }
        return true;
    }
}
```

Output:-

The screenshot displays the LeetCode submission page for the 'Find and Replace Pattern' problem. The interface is divided into several sections:

- Problem List:** Shows the problem name, 'Accepted' status, and submission details (submitted on Sep 18, 2026).
- Runtime and Memory:** The solution has a runtime of 1 ms (beating 74.58% of submissions) and a memory usage of 45.40 MB (beating 5.01% of submissions).
- Bar Chart:** A bar chart showing the distribution of runtime times for other submissions. The x-axis represents runtime in milliseconds (1ms, 2ms, 3ms, 4ms), and the y-axis represents the percentage of submissions. The solution's runtime (1ms) is highlighted as the fastest.
- Code:** The Java code for the solution is displayed, showing the `findAndReplacePattern` method and the `matches` helper method.
- Testcase:** The test result is shown as 'Accepted' with a runtime of 0 ms. The input is `words = ["abc", "deq", "mee", "aqq", "dkd", "ccc"]` and `pattern = "abb"`. The output is `["mee", "aqq"]`.
